### **MITSUBISHI – MAGNA - TE**

#T0087

**Make: Mitsubishi**

**Model: Magna TE V6**

**Subject: Erratic idle**

The Injectronics technical department have had recent enquires regarding Mitsubishi TE V6 Magna, which have an erratic idle after having disconnecting the battery for whatever work was required. Since investigating the matter it has been found that there is a reset procedure to follow after reconnecting the battery to ensure that correct engine idle quality is obtained. Note: It is imperative that all lighting and ignition is turned off before disconnecting or reconnecting the battery. Bring engine to normal operating temperature and allow it to idle for approximately 10 minutes under the following conditions to help stabilise engine control conditions and then check idle quality is satisfactory.

1. Engine coolant temp 85-95°C
2. Lights off
3. Engine cooling fans off
4. Accessories off
5. Trans in park or neutral
6. Steering wheel in centre position
